Fixed-model DD relocation: saved outcome

Numerical status: completed_attempt_pending_scientific_review. Exit code: 0.

Stopped stage: none.

The display uses verified accepted iteration 17 relative to the identified initial state. It does not establish a converged final solution.

The comparison uses identified catalog observations. History RMS and ray diagnostics describe pre-update states. A fixed-weight objective decrease is distinct from a change in unweighted RMS across iterations. No final convergence, updated-model accuracy, first-arrival or covariance claim follows from this saved-output display. The manuscript audit remains one reproduced panel and 61 partial panels.

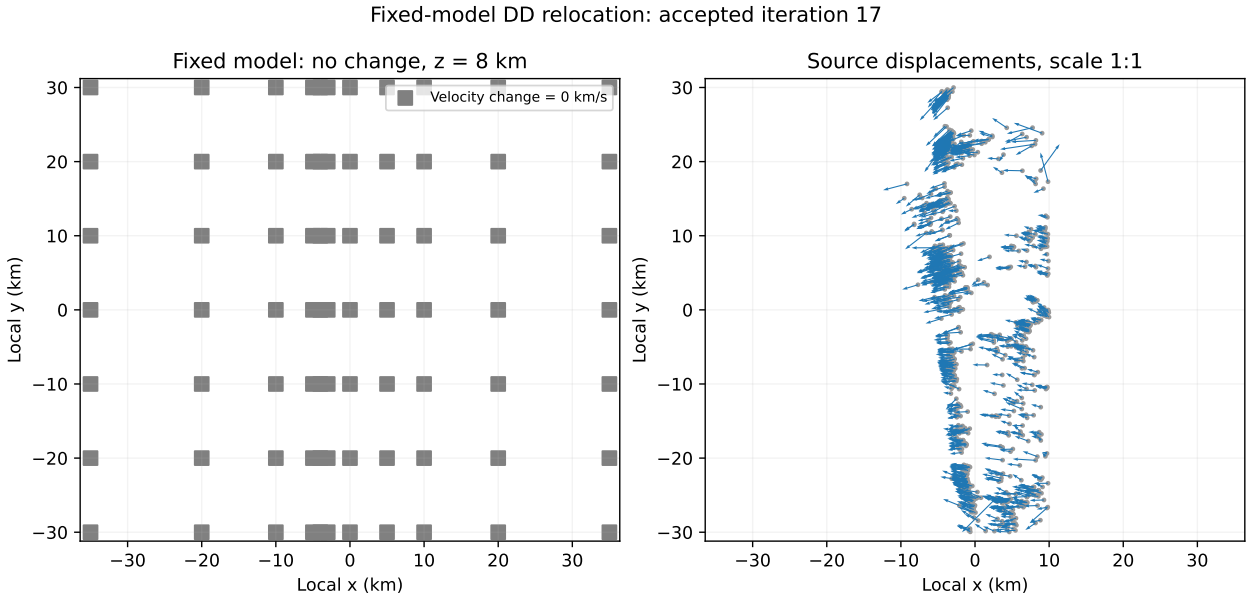

Figure 1: Saved model change and source displacement from the initial state. Arrows retain kilometre scale.
