Absolute-data tomography: saved outcome

Numerical status: failed_preserved. Exit code: -15.

Stopped stage: standard_invert.

No accepted update is verified. The closed attempt has no recovered model or relocated-source result to plot. Its numerical child ended by signal 15; this is an interrupted attempt, not evidence of nonlinear convergence failure.

The comparison uses identified catalog observations. History RMS and ray diagnostics describe pre-update states. A fixed-weight objective decrease is distinct from a change in unweighted RMS across iterations. No final convergence, updated-model accuracy, first-arrival or covariance claim follows from this saved-output display. The manuscript audit remains one reproduced panel and 61 partial panels.
